INSTALLATION / PROJECT CHECKLIST

Well prepared. Beautifully finished.

Six steps to discuss with your installer or stockist. Record the chosen variant below and check each preparation step.

Project	Article code / colour	Panel size (mm)

Collection sizes: 3000 × 1200 · 1200 × 600 · 900 × 600 mm

Use only the size confirmed for your chosen variant.

☐ 01 **Check the panel and substrate.**

Record the article code, colour and size. Check the delivery. Have the substrate assessed for strength, flatness, adhesion and moisture; confirm the application and adhesive system.

☐ 02 **Plan the panel layout.**

Choose the texture direction and panel arrangement. Mark joints, corners, openings and cut pieces. Compare colour and pattern in the lighting of the finished space.

☐ 03 **Confirm cutting and curved details.**

Request the appropriate cutting method. For curves, confirm the permitted radius and bending direction. Make a trial detail first; do not force the panel.

☐ 04 **Confirm the installation system.**

Obtain product-specific instructions, including suitable adhesive, application temperature, open time and curing time. The general material data sheet is not a complete installation manual.

☐ 05 **Resolve edges and junctions in advance.**

Detail joints, edges and corners for the loads and movement of the substrate. Have the complete build-up assessed for wet areas and external façades; a panel does not replace waterproofing.

☐ 06 **Protect and check the finish.**

Keep adhesive off the visible face. Protect the surface during adjacent works. Use a confirmed cleaning method and keep article codes and installation and care instructions with the project.

General project planning checklist. This document does not replace product-specific installation instructions. Follow the confirmed requirements of the panel and adhesive suppliers.
